

# Waste management in Albania: An opportunity to demonstrate commitment to EU integration

By Lorena Totoni, Leonie Vrugtman, and Diori Angjeli

Waste management is one of Albania's biggest environmental challenges, along with water and air pollution, land degradation, and biodiversity loss.<sup>1</sup> In 2011, the government drafted an ambitious National Strategy on Waste Management that aimed to align the country's legislation in this policy field to EU regulations. However, recent investments in the development of three waste incineration plants have raised serious concerns among environmental experts, civil society activists, local communities, as well as European Commission<sup>2</sup>, because these type of systems release hazardous carcinogenic and toxic chemicals that pollute the air, water, and soil. Thus, building these incinerators can have serious implications for public health and the environment in Albania. In addition, the planning and construction of these plants have been non-transparent, possibly rigged, and not in line with international standards. This paper contends that the Albanian government has an opportunity to demonstrate its commitment to EU integration by reconsidering its current approach to waste management. By prioritising recycling over incineration, Albania can show that it is serious about fulfilling the obligations of EU membership deriving from Chapter 27: Environment.

**Keywords:** *urban waste management; incineration; Albania; EU accession; environment*

## The Albanian National Strategy on Waste Management

In 2011, Albania launched its ambitious National Strategy for Waste Management, covering the 2010-2025 period, in which the government had hoped Albania would succeed in becoming an EU member state. That strategy sought to align Albania's legislation on waste management with the EU's Waste Framework Directive and the EU *acquis*. The legislative framework was based on the need to protect public health, the environment, and the economy, and aimed to turn waste management into a "priority issue"<sup>3</sup>. Like the EU's own waste management policy, Albania's strategy put emphasis on waste reduction, the recovery of resources, the maximisation of recycling, and re-use of waste<sup>4</sup>.

In 2012, The United Nations Economic Commission for Europe (UNECE) warned that the local expertise and the capacity of government institutions would not be sufficient to achieve the high standards that were set in Albania's waste strategy. To meet those standards, UNECE encouraged the Ministry of Environment, Forests, and Water Administration to strengthen its capacity, work towards increasing

<sup>2</sup> Concerns about the waste management are expressed in progress reports and in other studies commissioned by the European Commission, for example: Hogg, Dominic and Vergunst, Thomas (2017). "A Comprehensive Assessment of the Current Waste Management Situation in South East Europe and Future Perspectives for the Sector Including Options for Regional Co-Operation in Recycling of Electric and Electronic Waste", Publications Office of the European Union, available at: [http://ec.europa.eu/environment/enlarg/pdf/pilot%20waste/final\\_report\\_en.pdf](http://ec.europa.eu/environment/enlarg/pdf/pilot%20waste/final_report_en.pdf).

<sup>3</sup> Center of Official Publications (2011), "National Strategy on Waste Management (2011 – 2025)", available at: [http://www.qbz.gov.al/botime/fletore\\_zyrtare/2011/PDF-2011/36-2011.pdf](http://www.qbz.gov.al/botime/fletore_zyrtare/2011/PDF-2011/36-2011.pdf)

<sup>4</sup> *Ibid.*

waste management expertise, and cooperate with other ministries and local stakeholders to implement the waste management strategy<sup>5</sup>. Seven years later, the 2018 Commission report on Albania revealed that the implementation of the National Strategy for Waste Management remained at an early stage<sup>6</sup>, with large discrepancies between the established legal framework and the reality on the ground. The Commission highlighted that Albania should increase the separation of collection by preventing waste generation, promoting recycling, and reducing bio-waste.

However, since 2013, the government abandoned the strategy on waste and actually commissioned the construction of three incinerators, in Elbasan, Fier and Tirana, one of which is now operational. The National Strategy on Waste Management (2010-2025) does mention incineration as a means of waste management but states that this method has limited benefits and is a serious risk to the environment and human health<sup>7</sup>. Therefore, the strategy stipulated that incineration is only an option when other options are not feasible. The EU too holds that the incineration and disposal of waste are the least favourable options for waste management (see also Box 1) and “should be applied only after the other forms of waste management are fully exhausted”<sup>8</sup>.

The construction of these incinerators continued despite the many pitfalls. It caused the Albanian government to revise its 2011 national strategy, and the new draft, covering 2018-2033, is now available online<sup>9</sup>. The document still sets targets for recycling in line with EU legislation, but falls short of details on how the Albanian government plans to achieve them. The implementation of the new strategy is all the more an issue since the investment on incineration of 169 million euro is already quite large compared to the country’s GDP of 13 billion euro<sup>10</sup> and to the annual budget for urban waste management, which was just over 2 million euro in 2018<sup>11</sup>. This investment leaves little room for the creation of a better recycling system and the promotion of consumers’ waste prevention, for example, by re-using products.

### Incineration, the least preferred approach to waste management

In the new draft strategy for waste management (2018-2033), two benefits of incinerating waste are highlighted: the recovery of energy and the environmental benefits, when compared to the landfill method.<sup>12</sup> The first benefit, energy recovery, means that incineration of waste can be used to produce electricity or fuel for certain industrial processes. In Albania, the production of electricity, steam, or heating for buildings, is one of the main pillars through which the construction of the plants was justified. However, energy recovery through incineration is “often not the most efficient way of managing used materials, particularly those that are difficult to burn or which release chemicals at high temperatures”<sup>13</sup>. According to Paul Connett, retired professor in environmental chemistry and toxicology, three to four times more energy is saved when the materials are recycled instead of burned<sup>14</sup>. In terms of climate impact, incinerators release more CO<sub>2</sub> per unit of electricity than coal-

fired power plants<sup>15</sup>. Moreover, it is uncertain whether the incinerators in Albania can and will produce energy for the national market. One year after the Elbasan incinerator entered into force, it has not provided energy to the Albanian energy grid.<sup>16</sup> In part, this is due to the facility's inability to secure enough waste bound for incineration, but it is uncertain if the incinerator will recover enough energy to launch on the national network.

The second argument that is used to promote incineration, is that this method could reduce greenhouse gas emission, because incineration is less damaging than the landfill method<sup>17</sup>. In Albania, there are over 300 non-compliant and uncontrolled landfills<sup>18</sup>, known for their high potential of releasing methane and contaminating with chemicals the ground water, surface water, and soil. Indeed, compared to the landfill method,<sup>19</sup> incineration is a better option. However, at present there are many other underused alternatives for waste management in Albania that are less damaging to the environment, including waste minimisation, recycling, and repeated use of products (re-use)<sup>20</sup>. For this reason, the EU Waste Framework Directive insists on waste prevention rather than incineration or disposal (see Box 1). The framework of the National Strategy on Waste Management (2010-2025) also stipulated that incineration is only an option when all other possibilities have been exhausted. However, in the case of the incineration plant in Tirana – and possibly the other plants – alternative treatments of urban waste have not been considered. The feasibility study of the Tirana plant does not address any other means of waste management. As such, it cannot conclude that the establishment of a waste incineration plant is the most stable approach and the best solution<sup>21</sup>.

Box 1 Waste hierarchy as envisioned by the EU Waste Framework Directive<sup>22</sup>

### The risks for public health and the environment

In principle, the Albanian government recognises the need to re-use products and recycle waste. In 2012, the Council of Ministers<sup>23</sup> agreed that the environmental permit for the incinerators is only granted if the incineration plant guarantees to recycle recyclable waste where possible. For the incineration plant in Elbasan, the first plant that was finished and started to operate in 2017, all waste

of Elbasan municipality is transferred to the incinerator where a separation process takes place. Recyclable materials are transferred to recycling companies and non-recyclable (or: residual) waste is incinerated. However, journalist and environmental activist Arlis Alikaj discovered that no action was taken on actually separating recyclable waste from residual waste.<sup>24</sup> In other words: recyclable waste has been incinerated along with residual waste and has put recycling companies out of business. This means that the incineration plant in Elbasan is breaching the concession contract, which stipulates that the concessionaire is required to handle urban waste in accordance with Albanian legislation and good industrial practices. When the concessionaire breaches this agreement for more than 6 months, the concession contract may be terminated.<sup>25</sup>

Not only does the Elbasan incineration plant disrespect existing agreements, it also causes unimaginable environmental harm. Poor or incomplete burning of waste, especially when it concerns recycle waste such as plastics, can lead to the release of hazardous carcinogenic and toxic chemicals<sup>26</sup>. Particularly dangerous is the fact that incineration releases toxic nanoparticles that are small enough to penetrate the lung membrane and enter the bloodstream<sup>27</sup>. Once in the bloodstream, they can pass into every body tissue, including the brain, which can cause neurodegenerative diseases such as Alzheimer's, Parkinson's disease, or Huntington's disease.<sup>28</sup>

Despite these risks, there are currently no regulations in place in Albania to monitor nanoparticles emissions from incinerators, despite their well-known negative consequences for public health. Over the years, technological advances have made it possible to capture these pollutants but everything depends on how well the plants are designed, operated, and monitored, and how effectively regulations are enforced. This is why new incineration plants are usually subjected to rigorous investigation of the health risk they can pose.

### **Deficient project preparation**

The EU legislation for incineration plants sets parameters for emissions and requires these to be monitored. Many in Albania worry that the operational incinerator in Elbasan, and the planned incinerators in Fier and Tirana, are not developed according to this legislation. Albania has no previous experience with the construction of waste incineration plants and there is no rigorous and transparent Environmental Impact Assessment procedure accompanying the building permits of the incinerators. According to Lulzim Baumann and Stefan Schatz, both waste engineers with over a decade of experience with incinerators in Germany, the astonishingly low budget for the incinerators in Albania indicates that the quality of the plants will leave much to be desired.<sup>29</sup> The construction of the entire Elbasan plant was budgeted at €22 million, while in Germany only the filters for an incinerator – vital for ensuring that toxic chemicals are not released in the air – cost €28 million. With the money spent on the Elbasan plant, according to these waste engineers, only a non-filter incinerator can be built. This would mean that hazardous carcinogenic chemicals are released into the air, without any protection for public health or the environment.

To make things worse, there is no monitoring system in place to detect how large the impact is on the environment and public health. The measurement and control for the creation of a baseline of health indicators for the inhabitants of areas adjacent to the plant have not been carried out. The baseline should serve to set up a regular monitoring and evaluation system on the environmental impact of incinerators. The incinerator plant in Elbasan is now fully operational despite the absence of *ex-ante* or *ex-post* monitoring and evaluation systems, and notwithstanding a lack of guarantees that EU standards were upheld during its construction and operation.

Similarly, according to an investigation carried out by news website HASHTAG, the Environmental and Construction permits for the Fier incinerator have been illicitly obtained<sup>30</sup>, which has also caused doubts about the legality of the other construction permits. The area in which the incinerator in Fier is being built is certified agricultural land and the country's main cultivation site for the production of food destined to reach the national market (see Box 2). The contamination of air and groundwater that the Fier incinerator would cause, is qualified as an environmental crime according to the Albanian Penal Code and is punishable with up to ten years imprisonment<sup>31</sup>. However, as Albania lacks a national integrated environmental management system and monitoring data on air quality and greenhouse gas emissions, it is unclear whether the emissions from the incinerator will be properly monitored and evaluated<sup>32</sup>.

The incinerator of Fier is built approximately 700m from the Verri village, at the heart of the Myzeqe plain. The area is well-known for its fertile ground and considered as Albania's bread basket. Farmers in the wider region are concerned that the emissions from the incinerator will contaminate their crops with hazardous carcinogenic and toxic chemicals, while villagers are worried that the emissions will deteriorate the air quality therefore harming the local population.

The community has constantly raised its concerns over the potential consequences of the incineration process of this facility. In early 2018, residents of Verri initiated a petition against the construction of the incinerator, which was signed by 1,300 people. Subsequently, the local community and the Alliance against Waste Importing (AKIP) initiated a lawsuit against Integrated Technology Waste Treatment Fier (the company responsible for the incinerator) and two responsible ministries at the Administrative Court, with the aim of discontinuing the project. Their case was dismissed within a few days, but AKIP and the residents made a second attempt. Again, the case was overturned even though the court acknowledged the environmental concerns of the plaintiff.

**Box 2 The case of the waste incineration plant in Verri, Fier**<sup>3334</sup>

### **The capacity of incinerators**

On top of the previously presented arguments against the current approach of the Albanian government for waste management, another problem is that the combined capacity of the incinerators in Elbasan, Fier, and Tirana exceeds the amount of treatable waste produced in Albania (See box 3). The draft of the revised National Strategy of Waste Management (2018-2033) estimates that the combustible potential for the waste generated in Elbasan, Fier, and Tirana is only 26% (or

<sup>34</sup> Gjerani, Elisa. (2019). "Gjykata administrative rrëzon padinë e banorëve për Inceneratorin e Vërrisë", available at <https://portavendore.al/2019/06/21/gjykata-administrative-rrazon-padine-e-banoreve-per-inceneratorin-e-verrise/>

123,000 tons) of the projected capacity of these incinerators<sup>35</sup>. The incinerator in Elbasan has worked for less than 50% of the time in the first year it came into force, due to a lack of compostable waste.<sup>36</sup>

The amount of compostable waste is unlikely to increase over the next few years, due to a series of government initiatives that will promote recycling waste and re-using products. The draft strategy on waste management (2018-2033) has set recycling targets of 50% in 2020 and 65% in 2025, compared to 17% in 2017<sup>37</sup>. This new strategy recognises that the current approach to waste management makes it difficult for Albania to achieve the EU's mandatory recycling targets. To bridge the large gap between the capacity of the incinerators and the waste generated in Albania (it is currently estimated that 74% of the incinerator's capacity will remain unused), the government proposes to import waste from other municipalities or from abroad. This would create even more unnecessary emission of hazardous carcinogenic and toxic chemicals into Albania's water, air, and soil.

**Box 3 Visualisation of the capacity of the incinerators and the domestic waste suitable for incineration**

\*Our calculations assume that the total amount of waste generated in Albania remains the same, despite the shrinking population and an increased focus on waste prevention.

\*\*The calculations assume that from 2020 onwards, when the recycling target moves from 25% to 50%, the amount of domestic waste suitable for incineration will decrease by 15%.

\*\*\*The capacity increases as the incinerators in Fier and Tirana are expected to be completed, in 2022 and 2024, respectively (estimation).

### The lack of transparency

Besides the general criticism regarding incineration as a means of waste management, environmentalists, civil society, and the general public are also concerned about the lack of fair competition, transparency and public consultation during the planning and development of the incinerators in Albania<sup>3839</sup>. In April 2009, the Stabilisation and Association Agreement (SAA) between Albania and the EU entered into force. According to the SAA, the award of public contracts on the basis of non-discrimination and reciprocity is a key objective, a broader and deeper assessment of the public procurement and competition/State aid framework in Albania is necessary.<sup>40</sup> In 2014 and 2015, the government suddenly issued requests for tenders for the construction of three incineration plants.

<sup>39</sup> Environmental Center EDEN (2019), *Op. Cit.*

<sup>40</sup> Qendra e Publikimeve Zyrtare (2006), "Fletorja Zyrtare e Republikës së Shqipërisë", available at: [https://www.parlament.al/Files/Integrimi/marveshja\\_e\\_stabilizim\\_asociimit\\_be\\_shqiperi\\_23381\\_1.pdf](https://www.parlament.al/Files/Integrimi/marveshja_e_stabilizim_asociimit_be_shqiperi_23381_1.pdf)

Companies were able to bid for these tenders, which included the rights and funding to carry out the project, and it was expected that the projects would be granted to the best offer. According to documents obtained by *Voice of America*, all the bidders for these tenders were part of a network of small companies registered offshore and with – what were then – unknown owners<sup>41</sup>. *Voice of America* and *Exit.al* have now been able to track down these owners and found out that the majority of the companies were owned by the same group of people, most of whom are involved in the companies that eventually won the tenders<sup>42,43</sup>. The publication of these documents revealed that the bidding and selection process for these tenders has been non-transparent and rigged. If that were true, that would mean that the government acted in non-compliance with the SAA agreement.

On top of that, it would mean that the government acted in favour of people in its close circles, rather than in the interest of the Albanian people. The opposition has already accused the government of granting its clients concessionary contracts. Zef Preçi, Director of the Albanian Center for Economic Research, and Lavdosh Ferruni, environmental activist, even go as far as accusing the government of ‘clientele favouritism at the expense of Albanian taxpayers’<sup>44</sup>. Especially troublesome, is that in developing countries with a small GDP, like Albania, the large investments for an incineration plant are a huge burden on the state budget. Most of the money invested in the incineration plants will end up in the pockets of the companies that built them<sup>45</sup>. On top of the preliminary investment of 169 million euro for the construction of the plants<sup>46</sup>, the burning of the waste will be paid by the ‘polluter’ – that is, the Albanian people. For the next 30 years, the ‘polluter’ will pay 29 euros per ton of waste for incineration without a possibility to negotiate the terms or the tariff<sup>47</sup>.

After the companies won the rights and the funds for the projects, the lack of consultation with the public continued. Local communities remained uninformed about the location of the incinerators until a decision was already made, which has brought a lot of public protest and contestation<sup>48</sup>. Consequently, inhabitants of surrounding villages have repeatedly asked to be more involved and informed. In Fier, where the construction of the incinerator has begun about two years ago, inhabitants of neighbouring villages have started petitions, requesting public consultations, and protesting several times against the plans for the incinerator. In January 2018, a protest was violently suppressed by police intervention<sup>49</sup>. However, despite the existence of legislation that requires the local and central government to be transparent and respond to public calls for information, the government has not given any substantial information requested<sup>50</sup>.

## The way forward

This paper argues that the government's focus on incineration as a means of waste management – instead of prevention, re-use, and recycling – goes against the standards that are set in the *acquis* and could be a severe blow to Albania's EU accession process. Not only is incineration harmful for public health and the environment, but these projects have also been marred by controversies such as undue influence peddling. Hence, this paper puts forward a number of recommendations for the short- and long-term, to help improve Albania's approach to waste management and align it more with EU standards. These include:

- **The Ministry of Tourism and Environment should specify how it expects to meet the targets for recycling as stated in the draft of the National Strategy on Waste Management for 2018-2033.** Any budget that would become available after reconsidering Tirana's waste incinerator, should be redirected towards investments in more sophisticated methods of recycling. A better system for the re-use and recycling of waste is better for public health and contributes to a more sustainable and circular economy – all of which demonstrate the government's commitments towards upholding EU standards.
- **The European Commission should conduct a general evaluation of the Albanian government's incinerators tender procedures** as a response to complaints concerning the possible violation of the SAA (Articles 71, 74/3 and 126) and to questions raised by media on possible public-private partnership helped by the lack of transparency, the indifference on standards for fair competition and the distortion of the free market. If there was indeed a breach of the Agreement, a solution should be sought that is acceptable for both parties and is respectful to public health in Albania.
- **The Albanian government should consider cancelling, or at least sizing down, the planned waste incineration plant in the Tirana Municipality.** Not only is the construction of this waste incinerator the most expensive among all three plants, it is also the project that has least progressed of the three projects. By cancelling this €122 million project, by far the largest expenditure of the incineration plants, the government will have sufficient budget available for the implementation of an improved National Strategy on Waste Management.
- Although the case of the incinerator in Fier is still in trial at the administrative court, **we encourage the Prosecution Office to open a separate case that deals with the unlawful decision to allocate agricultural land for the construction of an incineration plant.** There is evidence that the building permit and Environmental Impact Assessment suffer major flaws that go against domestic legislation.
- **The Prosecution Office should assess whether the incineration plant in Elbasan has breached the concession contract by not handling recyclable waste properly.** According to this contract, the concessionaire is required to handle urban waste in accordance with Albanian legislation and good industrial practices. If obligations are breached for more than 6 months, the concession contract may be terminated.
- **Municipalities and other relevant public institutions should guarantee consultation processes with local communities,** as stipulated by law Nr. 146/2014 "On Notification and Public Consultation", offering meaningful opportunities for project managers to get input from local communities. Public consultations empower local communities and enable them to participate in the decision-making process, in a true democratic spirit.

Albania finds itself in a European context in which greener solutions to waste disposal, such as recycling and composting, are the norm. Establishing an 'incineration culture' in Albania goes thus against the national aspiration of achieving European integration with the European Commission having already expressed its discontent on the country's choice to rely on incineration.<sup>51</sup> Aside from

the more visible environmental issue, signs of corruption and poor impact assessment have created divisions between authorities and the local communities affected by the construction of these incinerators. Therefore, by reconsidering its current approach to waste management, the Albanian government has the opportunity to demonstrate its commitment to fulfilling the formal obligations under the Stabilisation and Association Agreement deriving from articles 71, 74/3 and 126, but also – as an aspiring EU member state - to show its devotion to the fundamental principles of the European Union.
